Thermal expansion of solid bodies

Thermal expansion of solid bodies

Measuring using the expansion apparatus

Objects of the experiment
- Measuring the linear thermal expansion of a brass tube as a function of the overall length.
- Measuring the linear thermal expansion of glass, steel and brass tubes and determining their linear expansion coefficients.

Principles
The length $s$ of a solid body is linearly dependent on its temperature $\theta$:

$$s = s_0 \cdot (1 + \alpha \cdot \theta) \quad (I)$$

$s_0$: length at 0 °C, $\theta$: temperature in °C

The linear expansion coefficient $\alpha$ is determined by the material of the solid body. For a given temperature difference between room temperature $\theta_1$ and steam temperature $\theta_2$, the change in length $\Delta s$ is closely proportional to the overall length $s_1$ at room temperature:

$$\Delta s \propto s_1 \quad (II)$$

Specifically, we can say:

$$\alpha = \frac{\Delta s}{s_1} \cdot \frac{1}{\theta_2 - \theta_1} \quad (III)$$

In this experiment, measurements of thermal expansion are conducted on thin tubes through which steam is channeled. The effective length $s_1$ of each tube can be set as 200, 400 or 600 mm by mounting it in a corresponding manner. A dial gauge with 0.01 mm scale graduations is used to measure the change in length.
**Apparatus**

**Setup**

Set up the experiment as shown in Fig. 1.

- Screw on the holder for dial gauge (e) (see Instruction Sheet for expansion apparatus) and clamp the dial gauge in place.
- Attach the fixed bearing (a) of the expansion apparatus at the 600 mark and slide the open end of the brass tube into the fixed bearing.
- Slide the closed end of the brass tube into the guide fitting (b) so that the hose nipple (f) is pointing laterally downwards.
- Tighten the screw to fix the brass tube in the fixed bearing (the screw must engage the ring groove of the tube).
- Insert the extension piece (c) (see Instruction Sheet for dial gauge).

- Cut off a 20 cm length of silicone tubing, slide the section over the hose nipple (f) and place a Petri dish below this to catch the condensation.
- Use the long tubing section to connect the open end of the brass tube to the steam generator.

Note: Danger of scalding when the steam generator is used improperly. Be sure to read the Instruction Sheet for the steam generator before using this apparatus.

**Carrying out the experiment**

- Determine the room temperature $\theta_1$ and write this down.
- Read off and write down the zero position of the dial gauge.
- Fill the steam generator with about 2 cm of water, close the apparatus and plug it in.
- Read off and write down the maximum pointer deflection of the dial gauge.
- Allow the brass tube to cool down to room temperature.
- Attach the fixed bearing of the expansion apparatus at the 400 mark and tighten the screw so that it engages the ring groove of the tube.
- Refill the steam generator with water, check the zero position of the dial gauge and repeat the measurement.
- Move the fixed bearing to the 200 mark and repeat the experiment.
- Replace the brass tube with the steel tube; attach the fixed bearing at the 600 mark and repeat the measurement.
- Conduct the same measurement on the glass tube.

</tbody>
</table>

Evaluation and results

\[ \vartheta_1 = 21 \, ^\circ C \]
\[ \vartheta_2 = 100 \, ^\circ C \]
\[ \vartheta_2 - \vartheta_1 = 79 \, K \]

a) Linear expansion of brass tubes of different lengths

![Graph](image)

Fig. 2: Thermal change in length \( \Delta s \) of a brass tube as a function of the overall length \( s \)

Fig. 2 shows a graph of the change in length \( \Delta s \) plotted as a function of the effective length \( s_1 \). As the measured values lie along the line drawn through the origin, this verifies the proportionality described in equation (II).

b) Linear expansion of tubes of different materials

The linear expansion coefficients are calculated from the measuring results of Table 1 in accordance with (III). Table 2 shows the results together with the literature values.
